

Ying-Hsiu Chen

Industrial IoT Product Designer / Business Analyst

Email: imshenchen@gmail.com | Phone: 0928-558-013 | Blog: medium.com/@yhuxchen
Portfolio: <https://imshenchen.github.io/yinghsiu-chen-portfolio/zh/>

Core Skills

Domain Experience

- B2B SaaS products
- Machine-connectivity platform (AIoT)
- Smart manufacturing systems for electronics assembly
- Built-in RAG and AI Agent in products

Cross-functional Collaboration

- Product managers
- Front-end & back-end engineers
- System architects
- On-site managers of electronics assembly lines
- System integrators (SI)

Areas of Strength

- Requirements interviews & analysis
- Product information architecture & spec definition
- AI integration feature planning
- User experience design
- Design system development
- AI-assisted development & workflow optimization

Education

Master's

Dept. of Industrial Design, Graduate Institute of Innovation & Design
National Taipei University of Technology
2013 – 2016

Bachelor's

Dept. of Industrial Design
National United University
2009 – 2013

Certifications

PAS+ AI Application Planner Competency Assessment (Beginner Level)

Industry Talent Competency Certification, Ministry of Economic Affairs
2025

Patents

Invention Patent I824741

Online signing system, method, computing device, and computer-readable recording medium
Co-inventor · Kdan Mobile

Design Patents D225489 / D224913 / D224568

Graphical user interface for computer program products
Co-inventor · Kdan Mobile

Professional Summary

10 years of B2B product design experience, specializing in product requirements definition, information architecture, UX design, and functional spec development. Experienced in manufacturing digital transformation, AIoT platforms with edge computing, and manufacturing execution system (MES) product development. Beyond effectively connecting R&D, production-line, and business-side needs to bring software products to launch, I am passionate about driving the optimization of internal development workflows through AI tools.

Work Experience

Senior Software Design Engineer

Delta Electronics | 2023/01 – Present

AIoT Machine-Connectivity Edge Computing Platform

- Gathered requirements through interviews with production lines and internal/external SIs; defined functional specs and information architecture; coordinated front-end/back-end engineers and system architects on implementation

Machine-Connectivity Platform Intelligent Assistant

- Served as one of the planners for the AI Agent, RAG knowledge base, and MCP configuration features; defined specs and information architecture; coordinated the engineering team on development
- After launch, the features significantly cut the time factory managers spent preparing daily/monthly reports and entirely eliminated the risk of manual data-entry errors

Electronics-Assembly Smart Manufacturing Execution System (MOM)

- Led requirements interviews, information architecture, and spec definition; features covered work-order dispatching, material preparation, WIP tracking, and process-history management
- Drove the definition of the design system, establishing unified design guidelines and a component library that greatly reduced front-end rework

Production-Line Management System

- Collaborated with a US equipment vendor to map out the functional specs and operational flows for migrating the original WinForm system to a web architecture
- Piloted a new AI-assisted development workflow: defined design-spec standards so engineers could read the spec sheets and develop directly with AI tools, without designer involvement throughout, greatly shortening development timelines

Business Analysis & Market Insights

- Conducted interviews with internal/external SIs and research on competitor trends; consolidated user insights to inform PM decision-making
- Drove business-model transformation analysis: helped shift from relying on SIs for market development to engaging factory end-users directly, repositioning SIs as technical partners

Product Designer / UX Designer

Kdan Mobile | 2016/05 – 2022/11

DottedSign — Enterprise-grade e-signature B2B SaaS product

- Acted as Feature Owner, responsible for requirements interviews, information architecture and spec definition, UX design, interactive prototyping, and development acceptance
- Building on the product skeleton defined by the PM, explored the true value of features, defined experience details and development specs, and ensured complete product delivery
- In Q3 2021 alone, planned 10+ new features together with PMs and engineers, supporting a successful price increase for the product in Q1 2022
- Helped PMs produce personas, user journeys, and other analyses to support product-direction decisions
- Ultimately helped DottedSign rise from “Niche” to “High Performance” in its G2 rating
